GPU优先级配置范围

- timelice 范围 1ms~50mis timeslice 优先级范围 0-2
- stream 优先级范围 0 ----- -5

GPU调度架构

AB定时1秒顺序启动,A执行21 msec, B执行4ms。AB都在默认流上

• 实验一: A=21ms, B=24ms

• 实验二: B 预分配更高优先级, A=25ms, B=5.7ms

C1执 行210 msec , C2执 行210 msec , 在另外一个进程里。

• 实验一:设置timeslice C1 =50ms, C2=1ms, C1=214ms, C2=321ms (上下问切换次数=4)

• 实验二:设置timeslice C1 =1ms, C2=1ms, C1=396ms, C2=397ms (上下问切换次数 =400)

• 实验二:设置timeslice C1 =2ms, C2=2ms, C1=361ms, C2=362ms (上下问切换次数 =200)

• 实验三:设置timeslice C1 =50ms, C2=50ms, C1=314ms, C2=321ms (上下问切换次数 =6)

DRIVE OS 接口名

```
#define NVGPU_TSG_IOCTL_BIND_CHANNEL \
#define NVGPU_TSG_IOCTL_UNBIND_CHANNEL \
#define NVGPU_IOCTL_TSG_ENABLE \
#define NVGPU_IOCTL_TSG_DISABLE \
#define NVGPU_IOCTL_TSG_PREEMPT \
#define NVGPU_IOCTL_TSG_EVENT_ID_CTRL \
#define NVGPU_IOCTL_TSG_SET_RUNLIST_INTERLEAVE \
#define NVGPU_IOCTL_TSG_SET_TIMESLICE \
#define NVGPU_IOCTL_TSG_GET_TIMESLICE \
#define NVGPU_IOCTL_TSG_GET_TIMESLICE \
#define NVGPU_TSG_IOCTL_BIND_CHANNEL_EX \
#define NVGPU_TSG_IOCTL_READ_SINGLE_SM_ERROR_STATE \

#define NVGPU_TSG_IOCTL_GET_L2_MAX_WAYS_EVICT_LAST \
#define NVGPU_TSG_IOCTL_SET_L2_SECTOR_PROMOTION \
#define NVGPU_TSG_IOCTL_BIND_SCHEDULING_DOMAIN \
```

结论

DRIVE OS 提供的调度机制为原有 NVIDIA GPU 调度提供了跨context调度的能力
